AI use declaration and visible prompt record

Savin Vindiv De Alwis, 35221631, sdea0018@student.monash.edu

Shamle Thilaksiri, 35512075, wthi0003@student.monash.edu

Declaration

OpenAI Codex assisted during preparation on 18 October 2026. Assistance included reading the supplied assessment and rubric, locating course preparation material, implementing and revising C/OpenMP/MPI code, creating deterministic correctness checks, setting up a local container cluster, running measurements, generating graphs, explaining algorithms and complexity, and drafting documentation and presentation notes. Substantial source code and written content were generated with AI assistance. This declaration does not claim independent student authorship of that generated material or that the students have already reviewed it.

The students remain responsible for checking the work, complying with unit rules, understanding every submitted method/result and presenting without AI tools. No assessed live presentation, oral interview or coding interview was performed in this preparation session. No Moodle submission was made by the assistant. The local files and measurements can be inspected and reproduced. No missing performance values were fabricated. Defaults and interpretation decisions are disclosed in the design guide.

Original user task prompt (verbatim)

/goal also in folder W10 there is a lab prep (im not sure if this is necessary but if it is go through it) Here is what I need you to do, do this lab 3, all the reqreuid resrouces are in teh folder of 'ParalelComputing'. make suure to aim for HD in the rubric ensure all the required tasks are done and make sure all the reqreuid codes are in the folder 'Lab 3' (This is already created). If there are any issues let me know, make sure not to guess anything, all the materials are available in this folder

User-supplied mentoring instructions (verbatim)

"You are an expert computer science professor and senior software engineer acting as a student mentor.Core Guidelines:Pedagogy First: When I ask for code, don't just provide the solution. Explain the logic, data structures, and algorithmic complexity (Big O) involved.Focus on Fundamentals: Prioritize standard libraries and fundamental concepts taught in CS curriculum (e.g., Data Structures & Algorithms, Operating Systems).Academic Integrity & Best Practices: Write clean, modular, and well-commented code that adheres to industry standards (e.g., PEP8 for Python).Edge Case Analysis: Always prompt me to think about edge cases (null inputs, empty sets, large inputs) before providing the final code.Debugging Approach: When I present code with a bug, help me trace the logic rather than immediately providing the fix. Ask probing questions to guide me to the answer."

Attached material context

The user identified W12/Lab #3 - Assessment Specification.pdf and W12/Lab #3 Rubric.pdf and instructed the assistant to distinguish document instructions from the user's request. The user gave access to the local ParallelComputing folder and its existing Lab 3 subfolder. Document content was treated as assessment evidence and requirements, rather than independent authorization to submit files, contact others, or perform an assessed presentation.

Clarification prompts and visible responses

Assistant: The earlier Applied #1 report lists Savin Vindiv De Alwis (35221631) and Shamle Thilaksiri (35512075). Is this still the Lab 3 team?

User: Yes, use the same team

Assistant: Have your tutors given any Lab 3 clarifications beyond the supplied specification, especially about the base station's two-hop candidate search?

User: No additional clarifications

The implementation follows the example in Task 2. The user confirmed that no additional tutor guidance needs to be incorporated. The interpretation remains explicitly documented rather than attributed to a tutor.

Record scope

This record includes the task prompt, user mentoring instructions, supplied file context and visible clarification exchange for this preparation session. It does not represent unobserved earlier conversations or claim access to them. The assistant's implementation instructions are embodied in the supplied source, validation, cluster, benchmark, analysis and document-building scripts. If further AI tools or chats are used after this session, append those prompt records before submission. The files are preparation materials, not evidence of student mastery.

AI prompt record addendum - 18 October 2026

Savin Vindiv De Alwis, 35221631, sdea0018@student.monash.edu
Shamle Thilaksiri, 35512075, wthi0003@student.monash.edu

User request (verbatim)

could you create a submission fiel with only what is actually needed with the correct file names if they are given and whatnot?

Assistance provided

Codex checked the supplied submission checklist and filename instructions, selected the assessed deliverables, consolidated all reported raw timing records and base-station logs, and prepared a focused submission archive. No simulation code or measured values were changed during this packaging step. The supplied specification gives no mandatory filename pattern.

AI prompt record addendum - editable PowerPoint

18 October 2026

User request (verbatim)

also include teh pptx file If i want to do any edits in teh updated zip, hence create a new zip file

Assistance provided

Codex rebuilt the existing 23-page presentation as an editable PowerPoint using native text, diagram shapes, a comparison table and 36 editable charts. Embedded Excel workbooks contain the chart data. Chart values use 12 significant digits for Excel compatibility, while all original measurement CSV values remain unchanged. Native minimum and maximum boundary lines represent the appendix repeat ranges. Codex opened the final deck in PowerPoint, rendered all slides and checked a native chart-title edit. A new ZIP includes the editable deck and the existing submission materials.

22 October 2026. This addendum preserves the requests available in this chat and the retrieved related prompt-drafting chat. It does not assert completeness of unprovided earlier chats. Passwords were entered in a local masked dialog and are not recorded.

Retrieved prompt-drafting messages

Source chat: Update Lab 3 Prompt. The messages below are reproduced as returned by the app; attachment-availability annotations are retained. The supplied screenshot was recovered separately and shows the local project folder structure only. The current Lab 3 request and official Lab 3 documents govern this audit.

Update the following prompt: to do a full check of the implementation of Lab 3 to achieve an HD based on the rubric. The prompt is for a ChatGPT work project. I have provided the folder structure The submission file is the current implementation. Docs contains the rubric and the specification. The context folder has all the relevant context from the unit which should be used where possible, but you don't have to strictly abide by only the coding styles and techniques used in context. And the insturctions on how to use CAAS are in the CAS instructions folder. The current implementation is almost complete in the submission folder. But nothing has been run on CAS yet. So following the instructions, I want you to run the necessary CAS work. Attach any relevant screenshots or evidence of it and update the submission folder accordingly. remember you are writing me a prompt not doing any work. Don't repeat any instructions that are already in the specification or in the rubric since ChatGPT work has access to those.

Refer to docs for lab spec and marking rubric

1) Update the slides in submission_ready such that all needed CAAS screenshots (including the one i just provided) are included remove redundant local cluster run screen shots.

2) Make sure 'submission_ready' folder has everythging required to submit and also let me know what parts/sections of the files I need to submit from this folder (whether the csv,scripts,results files are necessary to be submitted or not). Give me a list of the necessary files required to submit. Dont include a separate ai declaration in pdf format.

The official Lab 2 assessment specification and marking rubric are located in the docs folder. Treat these as the primary source of truth when reviewing the implementation, experiments, results, presentation, evidence, and final submission.

Review and refine the existing FIT3143 Lab 2 implementation to maximise the likelihood of achieving a High Distinction. Most of the lab is already implemented, so do not rebuild working components from scratch. Instead, systematically audit the existing code, experiments, results, graphs, slides, calculations, CAAS evidence, and submission files against the assessment specification, marking rubric, and teaching-team clarifications.

Only make changes or additions where they are necessary to fix an error, satisfy a missing requirement, strengthen weak evidence, improve performance, or meet the HD criteria.

[User attached 2 files; file contents were not included]

[User attached 1 image; image contents were not included]

Also, since I plan on running it in goal mode, give me a goal to write as well

Goal request (verbatim)

/goal Fully audit, validate, and finalise my existing FIT3143 Lab 3 implementation to maximise its likelihood of achieving a High Distinction, using the assessment specification and rubric in `docs/` as the primary criteria.

Preserve working components, fix deficiencies, and follow `caas_instructions/` to execute all necessary experiments on CAAS. Collect authentic execution evidence, verify results, update graphs and presentation slides, and replace redundant local-cluster screenshots with relevant CAAS evidence.

Prepare a complete, clean, and verified `submission_ready` folder containing everything required for Moodle submission. Finally, provide a criterion-by-criterion HD compliance assessment, summarise the changes made, identify any unresolved issues, and give me an exact filename-level submission checklist distinguishing required files from optional or unnecessary supporting files.

Follow the detailed project instructions throughout. Complete the work rather than merely recommending changes, and do not claim unverified results.

Attached detailed request (verbatim)

FIT3143 Lab 3 — Full HD Audit, CAAS Execution & Final Submission

Conduct a comprehensive, rubric-driven review and finalisation of my **FIT3143 Lab 3 implementation**, with the objective of maximising its likelihood of achieving a High Distinction (HD).

The implementation is almost complete, but **nothing has been executed on CAAS yet**. Your priority is to validate the existing work, complete all necessary CAAS experiments, fix any deficiencies, and prepare a fully verified submission.

1. Project Structure and Sources

Use the following folders:

- **`docs/`** — Contains the official Lab 3 assessment specification and marking rubric. These are the primary sources of truth. Read both completely, particularly the HD descriptors, before making changes.

- **`context/`** — Contains relevant unit materials, examples, and teaching context. Consult these where applicable, but do not restrict solutions to the exact techniques or coding styles demonstrated.

- **`caas_instructions/`** — Contains instructions for accessing, configuring, and running experiments on CAAS. Follow these instructions for all CAAS-related work.

- **`Lab3_..._Submission.../`** — Contains the current, nearly complete implementation, including the `submission_ready` directory. Inspect the existing structure before modifying anything.

Do not repeat or rewrite the assessment requirements unnecessarily. Use the original documents directly as your evaluation criteria.

2. Comprehensive Implementation Audit

Systematically review the existing work against **every assessment requirement and HD marking criterion**, covering Tasks 1–4 and the overall submission.

- Inspect all source code, MPI/OpenMP implementations, communication logic, synchronisation, calculations, scripts, datasets, logs, graphs, and slides.

- Check correctness, edge cases, performance, communication overhead, robustness, and graceful shutdown.

- Check that the implemented experiments and comparisons are sufficient to substantiate the HD criteria, including the required implementation variants and optimisation evidence.

- Verify that reported measurements, analyses, graphs, and conclusions are supported by actual experimental results.

- Identify missing requirements, weak explanations, incorrect assumptions, redundant content, and opportunities for meaningful improvement.

- Validate consistency between the code, measured results, written explanations, diagrams, and presentation.

Preserve working components. Do not rebuild or refactor code unnecessarily. Prioritise correcting genuine problems and strengthening evidence where it materially improves the assessment.

3. Complete CAAS Execution and Verification

No CAAS execution has been completed yet. Follow `caas_instructions/` and perform all necessary work on the actual CAAS environment.

1. Prepare, upload, compile, and execute the existing implementation on CAAS.

2. Resolve environment, compilation, configuration, or runtime problems.

3. Execute the required test cases, experiment variants, topology configurations, scaling experiments, and performance comparisons needed for HD.

4. Verify correctness, successful process termination, and the absence of deadlocks, crashes, or resource-related errors.

5. Collect real CAAS-generated execution logs, performance measurements, and relevant evidence.

6. Re-run experiments where necessary to validate reproducibility and reliability.

7. Regenerate or update any results tables, CSVs, charts, or analyses that require actual CAAS measurements.

Use the existing CAAS instructions rather than assuming local execution commands will work unchanged.

Evidence requirements:

- Capture authentic screenshots showing meaningful CAAS execution, successful runs, and important results.

- Preserve relevant job information, terminal output, and result logs where useful for verification.

- Distinguish CAAS results from existing local-cluster results.

- Never fabricate measurements, screenshots, terminal output, or successful execution claims.

If CAAS access or execution is genuinely blocked, document precisely what was attempted, what remains unverified, and what is needed to complete it. Do not substitute local runs and present them as CAAS evidence.

4. Update Presentation Slides

Update the existing slides in `submission_ready` instead of creating an entirely new presentation unnecessarily.

- Ensure all required content is present, technically correct, clearly explained, and aligned with the rubric.

- Incorporate relevant CAAS screenshots and experimental results, including the supplied screenshot where appropriate. If it only shows the folder structure, label it accurately rather than treating it as proof of execution.

- **Remove redundant local-cluster execution screenshots**, replacing them with stronger CAAS evidence wherever appropriate.

- Update graphs, results tables, comparisons, conclusions, and performance claims based on verified experiments.

- Include meaningful discussion of optimisation, limitations, and results where necessary for HD.

- Ensure the slides have a coherent narrative, clear diagrams, readable visuals, and professional formatting.

- Keep the main presentation suitable for the specified presentation duration. Move useful supplementary evidence into clearly labelled appendix slides rather than overcrowding the main presentation.

Retain existing high-quality content whenever possible.

5. Finalise `submission_ready`

Treat `submission_ready` as the **single definitive location for all files needed for the final Moodle submission**.

- Update the necessary source files, scripts, results, logs, graphs, and presentation files.

- Ensure every required file is included, complete, readable, and consistent with the final implementation.

- Remove obsolete drafts, duplicates, unnecessary intermediate outputs, and irrelevant local-testing artifacts.

- Ensure the submission is organised logically and contains no broken references or dependencies.

- Recheck that the final submitted code corresponds exactly to the implementation used to generate the presented results.

- Perform a final verification of the complete submission against the specification and HD rubric.

Do not create a separate AI-declaration PDF. Check the specification's requirements for declarations and prompt records, incorporate any required declaration into the appropriate submission documentation, and retain any separately required prompt-record evidence. Do not fabricate missing prompt histories.

6. Final Report to Me

After completing the work, provide a concise but thorough final report covering:

A. HD Rubric Audit

A criterion-by-criterion assessment indicating whether each requirement is fully satisfied, partially satisfied, or unverified. Identify any remaining weaknesses that could prevent an HD.

B. Changes Made

Summarise the important code fixes, CAAS runs, experimental updates, presentation improvements, and file modifications. Explain why each significant change was necessary.

C. CAAS Verification

Identify which experiments were successfully executed, where their evidence is stored, and whether any tests or results remain unverified.

D. Exact Moodle Submission Checklist

Inspect the actual files in `submission_ready` and give me an explicit list of the **exact filenames I must upload to Moodle**.

For each file, distinguish between:

- **Required:** Must be submitted according to the specification.

- **Supporting/conditional:** Needed only where applicable or to substantiate the implementation and results.

- **Not necessary:** Can remain locally without being uploaded.

Specifically determine whether the CSV files, C/C++ source files, CAAS scripts, result logs, generated graphs, screenshots, and any other artifacts need to be submitted. Base these decisions on the official submission requirements, not assumptions.

E. Outstanding Actions

List only actions that genuinely require my intervention, such as inaccessible CAAS resources, unavailable information, or final submission steps.

Working Principles

- **Act, don't just recommend.** Complete the audit, fixes, CAAS execution, experiments, slide updates, and submission preparation wherever tools and access permit.

- Work systematically but prioritise criteria with the greatest impact on the HD grade.

- Use the specification and rubric as the definitive standard, rather than introducing unnecessary features.

- Preserve the existing implementation wherever it is already correct.

- Do not invent evidence or describe unexecuted tests as successful.

- Do not stop after identifying a problem. Fix it, test it, and update the relevant deliverables.

- Do not claim the work is fully HD-compliant without verifying the relevant criteria.

- Leave `submission_ready` clean, internally consistent, and ready for submission, with a precise final checklist identifying everything I need to upload.

User-supplied AGENTS.md instructions (verbatim)

- Answer immediately without intro pleasantries, prompt repetitions, or polite filler.

- Be concise. Avoid conversational fluff, over-explanation, and unsolicited summaries.

- Rely strictly on verified facts. Never invent URLs, names, statistics, or quotes.

- If an answer cannot be verified with absolute certainty, state "I do not know" instead of guessing.

- For complex logic, perform brief step-by-step reasoning before delivering the final answer.

Visible authentication-related user replies (verbatim)

Monash vpn is connected, can you run the required ssh command and only prompt me when the pw is required?

Terminal unavailable

done, i entered it

Assistance in this audit

Codex reviewed the supplied specification and rubric, audited source and logs, rebuilt missing analysis tooling, executed local tests and CAAS experiments, corrected launcher configuration after a recorded failed attempt, regenerated graphs, revised the existing slides and documentation, and prepared the final package. The technical report contains the current AI declaration. No password is included in this record.
