

AI declaration and prompt record

Savin Vindiv De Alwis (35221631) — sdea0018@student.monash.edu

Shamle Thilaksiri (35512075) — wthi0003@student.monash.edu

Model and use

The current presentation documents OpenAI GPT-6, accessed through Codex. AI assisted research and source checks, drafting and revision of explanations and CUDA teaching examples, diagrams/charts, presentation formatting, the speaking script and submission packaging.

Record scope

This PDF reproduces the seven earlier prompt records saved in the project, seven continuation records, and seven later preparation-session messages. Original spelling is preserved. Earlier model versions were not recorded in the saved prompt files. The records include instructions subsequently superseded by later user requests; the final presentation reflects the later instructions.

The presentation itself contains one brief AI-use slide. This separate prompt PDF accompanies the submission under assessment instruction 9.

Record 1 — 6 October 2026 — Earlier task1 preparation, record 1

AGENTS.md instructions

<INSTRUCTIONS>

"You are an expert computer science professor and senior software engineer acting as a student mentor. Core Guidelines: Pedagogy First: When I ask for code, don't just provide the solution. Explain the logic, data structures, and algorithmic complexity (Big O) involved. Focus on Fundamentals: Prioritize standard libraries and fundamental concepts taught in CS curriculum (e.g., Data Structures & Algorithms, Operating Systems). Academic Integrity & Best Practices: Write clean, modular, and well-commented code that adheres to industry standards (e.g., PEP8 for Python). Edge Case Analysis: Always prompt me to think about edge cases (null inputs, empty sets, large inputs) before providing the final code. Debugging Approach: When I present code with a bug, help me trace the logic rather than immediately providing the fix. Ask probing questions to guide me to the answer."

</INSTRUCTIONS>

Record 2 — 6 October 2026 — Earlier task1 preparation, record 2

in folder "Applied 2" you will have the content I want you to work on, explain me what i need to do for task 1 (since task 2 is done by somebody else), create evrrythign later on if your creating in this folder, you can access all the content in this folder and help me do this applied correctly, fo rthe moment only tell me what I need to do for task 1

Record 3 — 6 October 2026 — Earlier task1 preparation, record 3

here is some more context as well which you can add on - Parallel Computer Applied 10 - Based on image rotations

Include diagrams

for task 1 - (4min)

focus on the Part D of the workshop from collab -

Part D: Reflection Questions

Answer the following questions.

What is the role of the host and device in CUDA?

How are threads organised into blocks and grids?

Why is brightness adjustment considered a data-parallel problem?

Why does GPU acceleration generally improve as image size increases?

What overhead is introduced by CPU-GPU memory transfers?

How many threads are launched when using:

Image = 1024 x 1024

Block Size = 16 x 16

If the GPU contained thousands of CUDA cores, how can they process millions of image pixels?

Task 2 - (3min)

explain how HPC is related to parallel computing

how HPC relates to scaling and AI

make sure to include statistics and charts (make sure to get proper citation) and make sure you are able to properly explain this and the trend.

- make sure to cover a few points not all (out of a,b,c,d), but not all have to be in detail (since some of them overlap) - make sure atleast 1 point is explained in detail.

Ex:

total time to present 7 mins

can task 1 be done by you or does it requireis desgnig somethign ? if you can do it go ahead and do task 1

Record 4 — 6 October 2026 — Earlier task2 preparation, record 1

Are you able to push the changes to this git page and create a new folder named applied2
<https://github.com/Shamle-T/FIT3143-Parallel-Computing> dont include any refernces of codex in the naming when your creating a new folder. Let me know whether this is possible

Record 5 — 6 October 2026 — Earlier task2 preparation, record 2

using a detailed comit message push the current changes to git and also do we need to do any code for task 1?

once pushed do task 2 as well, and push the task 2 to git are required

Record 6 — 6 October 2026 — Earlier task2 preparation, record 3

1)once you have compelted task 2, make sure you have aimed for HD in rubric yeah? for both task 1 and task 2 - if not update both tasks to cover HD level in the rubric

2) create a 6 minute script for both me (task1) and (task2) for my firend , make sure it doesnt sound overly robotic since we will have to speak this out.

Record 7 — 6 October 2026 — Earlier task2 preparation, record 4

Six minutes total: 3 minutes each

Record 8 — 8 October 2026 — Repository synchronization

pull the latest from the remote repo, push any local changes and merge, local changes arent important. main goal is to get the latest version of the "applied2" dir from the remote

Record 9 — 8 October 2026 — Review request

- review the content in the root level context folder (with an emphasis on week's 7-9).
- Review the solutions to task 1 and task 2 in applied2 based on the specification [Applied #2 - Assessment Specification.pdf](<\<applied2/assessment/Applied #2 - Assessment Specification.pdf>>) .
- Identify any key HD blockers in the solutions based on the rubric attached.
- The solutions dont need to only use the theory in the context folder but where possible, they should.

Record 10 — 8 October 2026 — Current preparation instructions

AGENTS.md instructions

<INSTRUCTIONS>

- Answer immediately without intro pleasantries, prompt repetitions, or polite filler.
- Be concise. Avoid conversational fluff, over-explanation, and unsolicited summaries.
- Rely strictly on verified facts. Never invent URLs, names, statistics, or quotes.
- If an answer cannot be verified with absolute certainty, state "I do not know" instead of guessing.
- For complex logic, perform brief step-by-step reasoning before delivering the final answer.

</INSTRUCTIONS>

Record 11 — 8 October 2026 — Recorded review goal

Review the solutions to task 1 and task 2 in applied2 based on the specification [Applied #2 - Assessment Specification.pdf](<applied2/assessment/Applied #2 - Assessment Specification.pdf>).

Identify any key HD blockers in the solutions based on the rubric attached. Dont stop until you are certain you have identified every HD blocker and created an action plan which you can later execute to update the solutions to fix all problems.

Record 12 — 8 October 2026 — Revision and presentation request

Now, fix all the identified problems and HD blockers. Don't stop until you're confident that task 1 and task 2 have a high probability of achieving an HD as per the applied-to rubric. Also refer to teaching_team_guidance.md, which is in the applied2 directory. Also ignore the Q&A and "Presentation Quality" in the rubric as these will be done by me. You need to create the presentation but dont worry about presenting it. Once you are confident with the task 1 and 2 solutions create a presentation as per task 3 (again dont worry about task 3 part c). Ensure the presentation is professionally formatted and contains all key details as I will not be submitting any other report, all info must be present in the presentation.

Record 13 — 8 October 2026 — Identification details supplied

Savin Vindiv De Alwis (35221631) - sdea0018@student.monash.edu

Shamle Thilaksiri (35512075) - wthi0003@student.monash.edu

Record 14 — 8 October 2026 — Continuation request

continue where you left off

Record 15 — 8 October 2026 — Brief presentation AI declaration

You do not need to individually identify every single prompt asked in the AI declaration on the presentation. Replace all of this with just one slide, which states which AI models were used and how they were used, briefly. That's it. Remove all the slides where you've just listed the prompts that I gave you.

Record 16 — 8 October 2026 — Website references only

From the references, remove any references to local content in the context folder. Only include references to websites.

Record 17 — 8 October 2026 — Essential evidence beside each answer

Review all of the content in the slides. If there are any diagrams or equations or calculations or code or anything else that's crucial or a core part of the answer to one of the Task 1 or 2 questions, move it from the appendix and directly put it in the answer in the slide that contains the answer to that section.

Record 18 — 8 October 2026 — Reference pagination

move reference 17 on page 40 to page 39, adjust spacing to make room for it

Record 19 — 8 October 2026 — Seven-minute presentation path

I need to be able to fit the entire slides before the appendix. So from the start until the conclusion in a seven-minute presentation. So try and ensure that only the most crucial content required for each of the answers to Task 1 and Task 2 is present in the first couple of slides, and anything that is non-crucial and supporting evidence can be moved to the appendix, as the appendix does not need to be presented. Make sure you don't cut down on any content. There's no limit to the number of slides; you can have as much content in the appendix as necessary. It's just that the first couple of slides, the ones that need to be presented, should be able to present within seven minutes.

Record 20 — 8 October 2026 — Conversational speaking script

Now generate a script. It shouldn't sound too formal. It should be in speaking language for the presentation.

Record 21 — 8 October 2026 — Submission packaging and push

Place all materials that need to be submitted inside of one folder, inside the Applied To folder, and then push the changes.
